

FLUOROFUNCTIONALIZATION OF METAL CORROLES

Dominik Krisch, Michael Haas, Sabrina Gonglach, and Wolfgang Schöfberger

Institute of Organic Chemistry, Johannes Kepler University Linz, 4040 Linz, Austria

Based on the methodologies for installing CF_x -groups ($X = 2$ or 3) published by the groups of Olah and Hartwig, either via cyclopropenation with the Ruppert-Prakash reagent [1] or C-C coupling of ArHal ($\text{Hal} = \text{Br}$ or I) with $(\text{phen})\text{CuCF}_3$ [2] we intend to expand the scope of these fluorofunctionalizations to metal corrole macrocycles (Figure 1) for the development of new catalysts for small molecule activation (HER, OER, and CO_2 reduction). Furthermore, we report the effect of the (additional) fluorinated groups attached at the *meso*-substituents or β -pyrrolic positions of the 18π -electron macrocycle onto photo- and electrochemical properties.

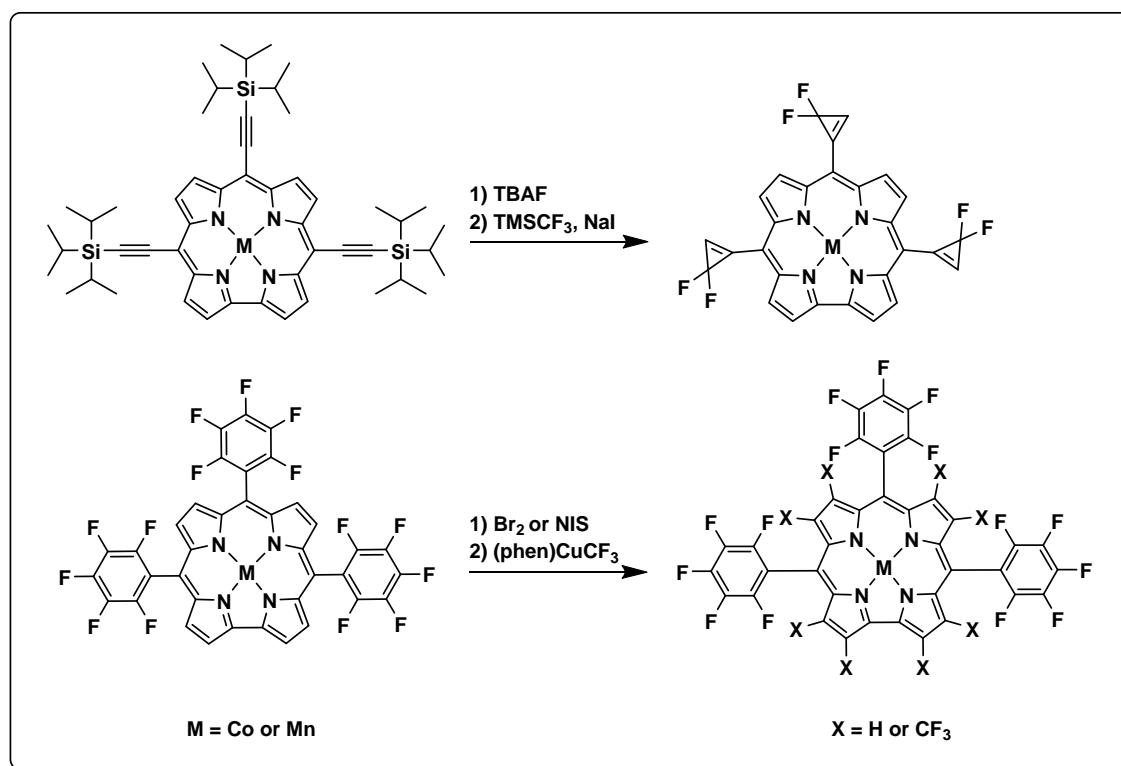

Figure 1: Envisioned reaction scheme for the fluorofunctionalization of metal corrole macrocycles.
