Fluoroalkylated cyclic $\lambda^3$-iodanes are reagents for electrophilic trifluoromethylation [1] or tetrafluoroalkylation [2] of various nucleophiles (Figure 1A). In our previous work [3] we showed application of these reagents in thiol bioconjugation (Figure 1B).

In this study we have shown rapid and mild radical functionalization of small molecules (indoles and pyrroles) and biomolecules (peptides or proteins) on aromatic amino acid residues with high selectivity toward tryptophan, using fluoroalkylated $\lambda^3$-iodanes and biocompatible reductant, sodium ascorbate (Figure 1C).

We would like to thank Michal Korecký for his help with MS sample preparation. Financial support from Academy of Sciences of the Czech Republic (RVO: 61388963) and Czech Science Foundation (17-00598S) is acknowledged.
