<sup>b</sup> Doctoral and Postgraduate School, Universidad de La Laguna, Spain

An integrative pericyclic manifold is developed for the construction of topologically diverse, structurally complex and natural product-like polycyclic chemotypes. The manifold uses readily and highly accessible tertiary propargyl vinyl ethers (**1**) as substrates and an all-pericyclic domino process to form complex polycyclic compounds with up to 2 new rings, 3 new C-C bonds, 6 stereogenic centers and one transannular bridge (**2a/2b**). The domino process is efficient, diastereoselective, scalable and instrumentally simple to perform and includes a Propargyl Claisen rearrangement - [1,3] H-shift -  $6\pi$  electrocyclization - intramolecular Diels-Alder reaction.<sup>[1]</sup> The synthesis of oxacyclic and azacyclic structures will be discussed.

Acknowledgements: The authors thank the Spanish Ministry of Economy and Competitiveness (MINECO), the European Regional Development Funds (ERDF) (CTQ2015-63894-P), and the Canarian Agency for Research, Innovation and the Information Society (ACIISI) (ProID2017010019 ACIISI/FEDER, EU) for financial support. S.D.H. thanks La Laguna University and Cajasieta for a predoctoral contract. Congress participation is financed by staff training grant of the ULL by the Ministry of Economy, Industry, Commerce and Knowledge, co-financed by 85% by the European Social Fund.
